

# **Basic Git & GitHub operations**

## **Week 8**

**Data Science  
Academy**

**HOMEWORK**

### **Operate following tasks:**

1. Start git bash in the folder containing latest Python case study and initiate git.
2. Make changes in scripts and save changes by applying git commands on those files.
3. Create a new remote repository in GitHub account and make connection between local and remote repository.
4. Push files (scripts) to remote repository using git commands.
5. Fork other users' repositories to your account.
6. Clone forked repositories to your computer (local repository).
7. Make pull requests and respond other users' pull requests.
